

Abstract

A monitor device for marking a reference location on a computer screen. The reference location can be, for example, a data point on the screen that a user needs to note. This would be advantageous, for example, when the user is checking a spreadsheet of data. Often when the user refers back and forth between a computer screen and a hard copy, the user loses track of the user's place on the screen. The monitor guide can be used to keep track of where the user is on the screen. The monitor guide features two rods that move with respect to the screen and intersect at a point used to mark the reference point.
